

Why I got AA.....(CS 733)

This essay belongs to a course I had at IITB CS 733 {Engineering a cloud}. The Prof had kept this name 'Engineering a cloud ' and he made it worth. After a long era we got a course in which we had to do some engineering stuff. The course was related to all scenario that are best and effective at engineering market. In the very beginning we were afraid of not able to handle the course load and the way Prof. wanted us to make thing rather I would say build things on which you can believe that yes, this is what I have made and I believe on what I have made. I joined that course with no background of distributed system ,client server architecture, multi-threading or more clear I had a 'NULL' set over implementation of all technique told above. I started my journey with prof and his encouraging behaviour .I kept on building fundamental blocks and worked hard to get my work done synchronized with prof. expectation. The main motivating point in that course was, we were really making stuff instead of listening some '*satsang*' in the classroom for entire lecture where you are welcome to sit, listen, and go. IT was the first time in the history that we selected a course without bothering about grades we will get, because while selecting the course and after looking at the expectation, we felt like we would get screwed in terms of grades. But we had a belief that we would be ending up with some real stuff and would be standing in the market to compete. We kept on adding level of quality the project work we decided to do. Finally we ended up with a system which was working and meeting the prof. expectation and our expectations too 😊.It was really first time in the history when we didn't care about the grades and just worked in a feel free way. I think this might be the reason I ended up with AA grade in that course. Fences always lessen exposure but once you get rid of it you won't regret.

Thank you
